

CH iDesign & Renovation — Repo Rename Log

RENAMING `CHIDR-INTERIOR` → `CHIDR-INTERIOR-MOCKUPV2`

Project	CH iDesign & Renovation — Website Revamp
Operation	GitHub repository rename + deployment realignment
Status	Complete
Date	28 May 2026
Prepared by	Adron Lim
Commit	<code>d4dead0</code> on <code>main</code>

I. Summary

The GitHub repository was renamed from `adronlim/chidr-interior` to `adronlim/chidr-interior-mockupv2` to match the local working-directory name. All deployment-affecting configuration was updated in the same commit so the GitHub Pages build continues to serve correctly under the new path.

The change is fully reversible (see [§7. Reversal](#)). The canonical Pages URL is now `https://adronlim.github.io/chidr-interior-mockupv2/` ; the previous `/chidr-interior/` URL is no longer routable.

2. Starting State

ITEM	VALUE
Local folder	<code>chidr-interior-mockupv2</code>
GitHub repository	<code>adronlim/chidr-interior</code>
Local git remote	<code>https://github.com/adronlim/chidr-interior-mockupv2</code> (stale — pointed at a name that did not exist)
Vite base path	<code>/chidr-interior/</code>
<code>package.json</code> name	<code>chidr-interior</code>
SEO absolute URLs	<code>https://adronlim.github.io/chidr-interior/</code> (in <code>index.html</code> , <code>public/sitemap.xml</code> , <code>public/robots.txt</code>)

3. How the Mismatch Surfaced

A routine `git push -u origin main` from `main` failed with:

```
remote: Repository not found.
fatal: repository 'https://github.com/adronlim/chidr-interior-mockupv2/' not found
```

This is the standard 404 response GitHub returns for both **non-existent** and **inaccessible** repositories. To disambiguate, the `gh` CLI was used:

```
gh repo view adronlim/chidr-interior-mockupv2
# GraphQL: Could not resolve to a Repository ...

gh repo list adronlim --limit 20
# adronlim/chidr-interior    public    2026-05-27T23:15:10Z    ← actual repo
```

The repository genuinely did not exist at the local remote's URL; the actual repository on GitHub was still named `chidr-interior`.

4. Decision

Two viable paths were considered:

OPTION	ACTION	TRADE-OFF
A. Keep GitHub name	Restore the local remote URL to <code>chidr-interior</code> . No code changes.	Local folder name and GitHub name remain out of sync. Live URL unchanged.
B. Rename GitHub repo	Rename GitHub repo to match local folder + update all configs.	Live URL changes (breaks bookmarks and search indexing). Local and GitHub names finally aligned.

Option B was chosen to bring the GitHub repository name into line with the local working directory.

5. Steps Performed

5.1 Rename the GitHub repository

```
gh repo rename chidr-interior-mockupv2 \
  -R adronlim/chidr-interior --yes
```

GitHub returns no output on success. Verification via `gh repo view adronlim/chidr-interior-mockupv2 --json homepageUrl,url` confirmed the new name.

5.2 Update deployment-affecting configuration

Five files reference the project slug in deployed assets:

FILE	FIELD / LOCATION	CHANGE
vite.config.js	base	'/chidr-interior/' → '/chidr-interior-mockupv2/'
package.json	name	"chidr-interior" → "chidr-interior-mockupv2"
index.html	5 absolute URLs	canonical , og:url , og:image , twitter:image , JSON-LD url + image
public/sitemap.xml	<loc>	Project URL
public/robots.txt	Disallow: + Sitemap:	Admin disallow path + sitemap URL

The local git remote URL already pointed at `chidr-interior-mockupv2` (this was the original cause of the failed push), so it required no further change — once GitHub had been renamed, the URL was valid.

5.3 Commit and push

```
git add index.html package.json public/robots.txt \
    public/sitemap.xml vite.config.js
git commit -m "Rename project to chidr-interior-mockupv2: \
update base path and SEO URLs"
# [main d4dead0] 5 files changed, 13 insertions(+), 13 deletions(-)

git push -u origin main
# 1853baa..d4dead0  main -> main
# branch 'main' set up to track 'origin/main'.
```

5.4 (Later) Update the GitHub repo "homepage" field

The sidebar "homepage" link on the GitHub repository page was set via:

```
gh repo edit adronlim/chidr-interior-mockupv2 \
    --homepage "<chosen URL>"
```

The canonical choice for this field is the live deployment URL

(<https://adronlim.github.io/chidr-interior-mockupv2/>); any other value will misattribute the repository when visitors click through.

6. Items Deliberately Not Changed

The following references to `chidr-interior` were left in place because they document the historical state of the project rather than configure its current deployment:

- `CLAUDE.md` — references to the prior project name in development guidance
- `context.md` — historical setup commands (`yarn create vite chidr-interior ...`) and project-tree examples
- `docs/phase-1-frontend.md`, `docs/seo-recommendations.md` — phase reports issued at the time of the previous name

The brand domain `chidr.com.my` (in `settings.js` and `index.html` JSON-LD) is the company's email/web domain, distinct from the repository slug, and was not touched.

7. Reversal

The rename is fully reversible. To restore the previous state:

```
# 1. Rename the GitHub repository back
gh repo rename chidr-interior \
  -R adronlim/chidr-interior-mockupv2 --yes

# 2. Revert the configuration commit
git revert d4dead0
git push
```

The local folder name does not affect git or deployment and can be left as `chidr-interior-mockupv2` or renamed independently with `mv`.

8. Caveats and Follow-Ups

- **Old GitHub Pages URL is dead.** `https://adronlim.github.io/chidr-interior/` no longer routes. GitHub Pages does not issue redirects for project-page renames. Inbound links, prior search-engine results, and any saved bookmarks pointing at the previous URL will return 404.
- **Pages workflow trigger.** `.github/workflows/static.yml` triggers on pushes to the `github-static-deploy` branch, not `main`. The configuration commit on `main` does not, by

itself, cause a redeploy. A separate push or merge into `github-static-deploy` is required to publish the rebuilt site under the new URL.

- **Repo "homepage" field accuracy.** Whatever value is set via `gh repo edit --homepage` becomes the link visitors see in the GitHub sidebar. Keep this in line with the actual deployed URL to avoid misdirecting users.
- **Documentation drift.** As noted in §6, several documentation files still reference the previous name. These can be updated in a follow-up pass if a clean documentation cut is desired — they have no effect on the build, deployment, or SEO.

This document is a point-in-time record of the rename operation. The canonical configuration is whatever is currently checked in to `main`.
